Multiple Agencies Coordinating Further HAZMAT Response

Amarillo, TX – The Environmental Protection Agency (EPA), Texas Commission on Environmental Quality (TCEQ), Texas Panhandle Poison Center (TPPC), and City of Amarillo are working collaboratively to investigate the tragic incident which occurred as a result of misuse of a regulated pesticide known as aluminum phosphide. The site of the incident is secured and does not pose any health hazards to the surrounding community. Multiple local, state, and federal agencies are committed and working together to ensure the public's safety.

If you believe you have been exposed to this regulated pesticide, contact the TPPC at 800-222-1222. A representative will have a series of questions to assist you in determining appropriate steps to follow based upon the information you provide.

If you are not a licensed pesticide applicator and believe you may have aluminum or zinc phosphide in your possession, the City of Amarillo advises that you immediately evacuate individuals and animals from the area where it is stored and then contact the TPPC. Only licensed professionals should have access to and are equipped to dispose of this product. You should not attempt to dispose of these chemicals yourself as there is a risk of injury and death. The TPPC representative will obtain the necessary information and provide you with further instructions for disposal of the product by the appropriate authorities.
